

# Rapid rise in premature mortality in fast-growing tropical cities due to anthropogenic air pollution

**Karn Vohra** (k.vohra@ucl.ac.uk), E. A. Marais,  
W. J. Bloss, J. Schwartz, L. J. Mickley,  
M. Van Damme, L. Clarisse, P.-F. Coheur

# Tropical cities are experiencing unprecedented growth

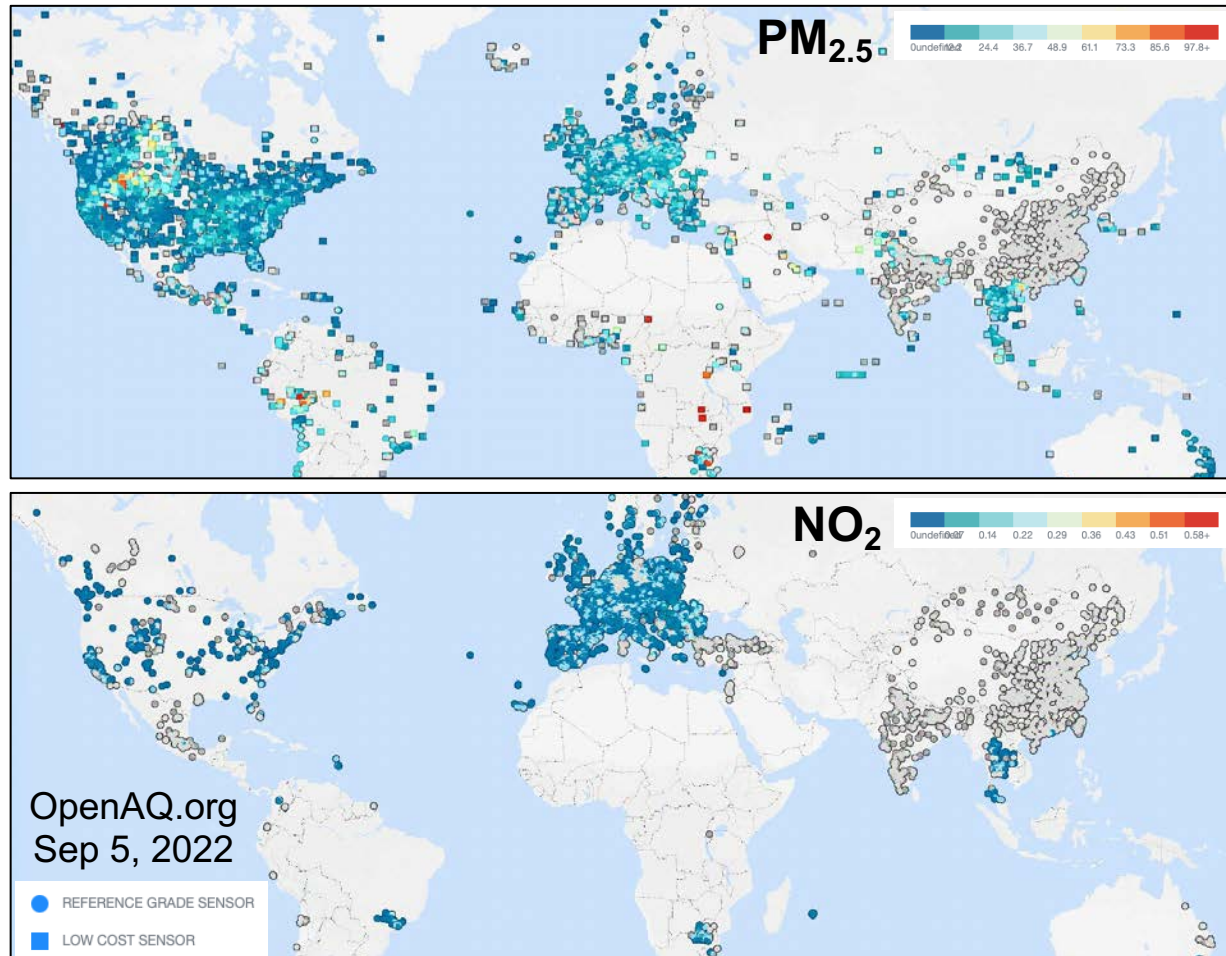

46 cities in tropical Asia, Africa and the Middle East will be megacities by 2100

Forecast annual growth rates for 2020-2100: 3-31% in Africa, 0.8-3% in **South Asia** and 0.5-7% in **Southeast Asia** [Hoornweg & Pope, 2017]

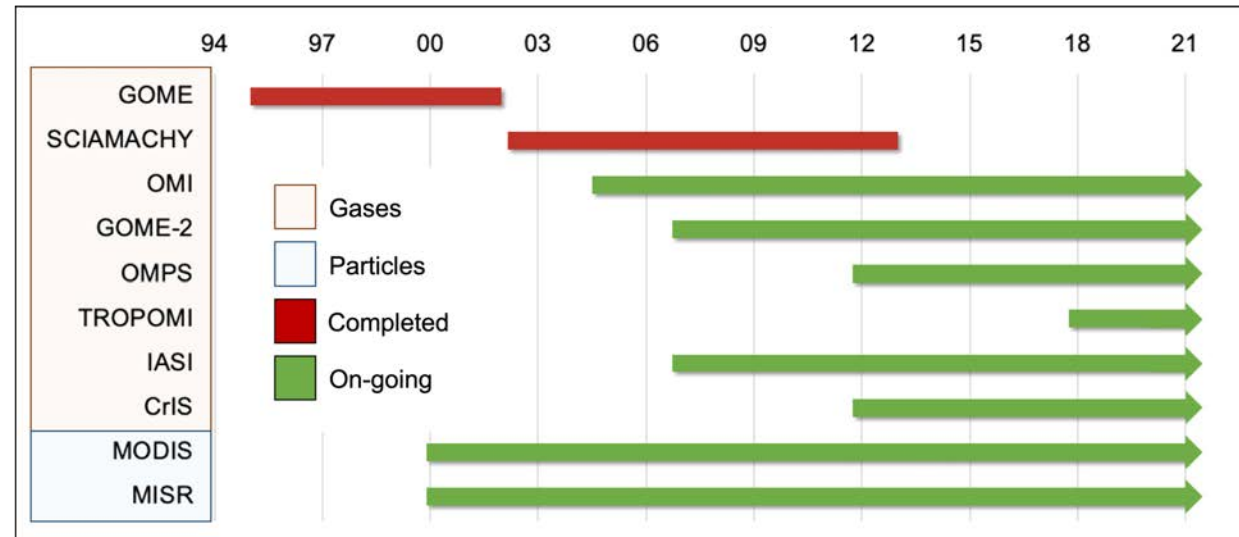

# Tropical cities are the next frontier in air pollution

Currently, limited surface monitoring of air pollutants across the tropics

< 1 monitor per million people in the tropics  
[Martin et al., 2019]

Long and consistent record of atmospheric composition from space-based instruments

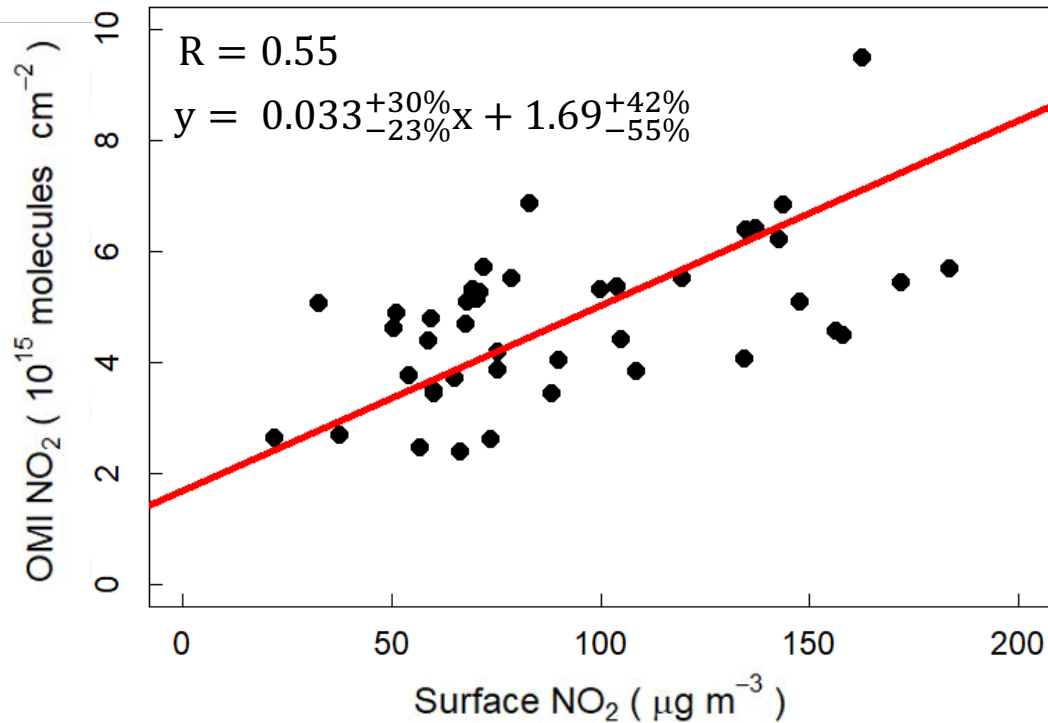

**OMI** for **NO<sub>2</sub>** and **HCHO** (proxy for NMVOCs)

**IASI** for **NH<sub>3</sub>**

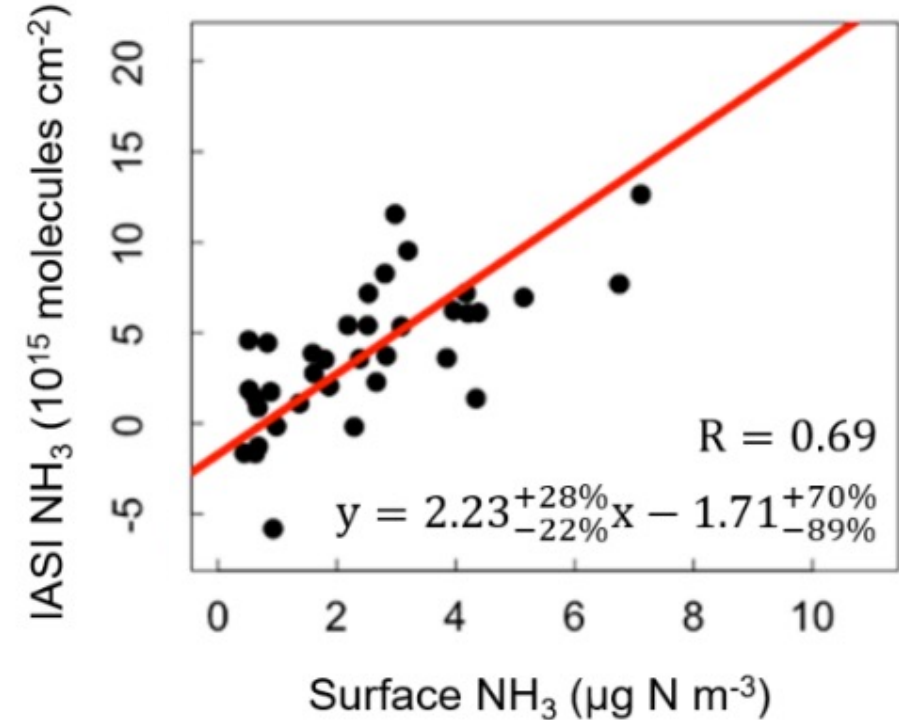

**MODIS** for **AOD** (proxy for PM<sub>2.5</sub>)

# Assessing the skill of satellite observations at reproducing variability in surface air quality

Satellite versus surface  $\text{NO}_2$  in **Delhi, India** (2011-2018)

Satellite versus surface  $\text{NH}_3$  at the background site **Harwell, UK** (2011-2015)

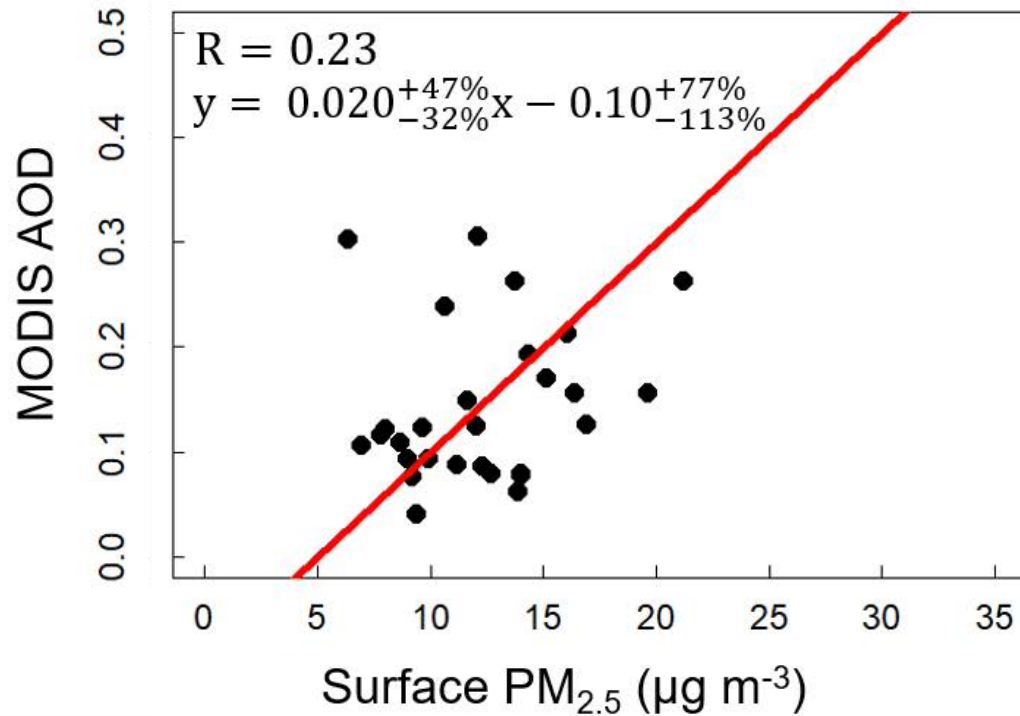

Temporal consistency between satellite and surface measurements of  $\text{NO}_2$  and  $\text{NH}_3$

[Vohra et al., *ACP*, 2021]

# Satellite observations of AOD reproduce long-term trends in PM<sub>2.5</sub>

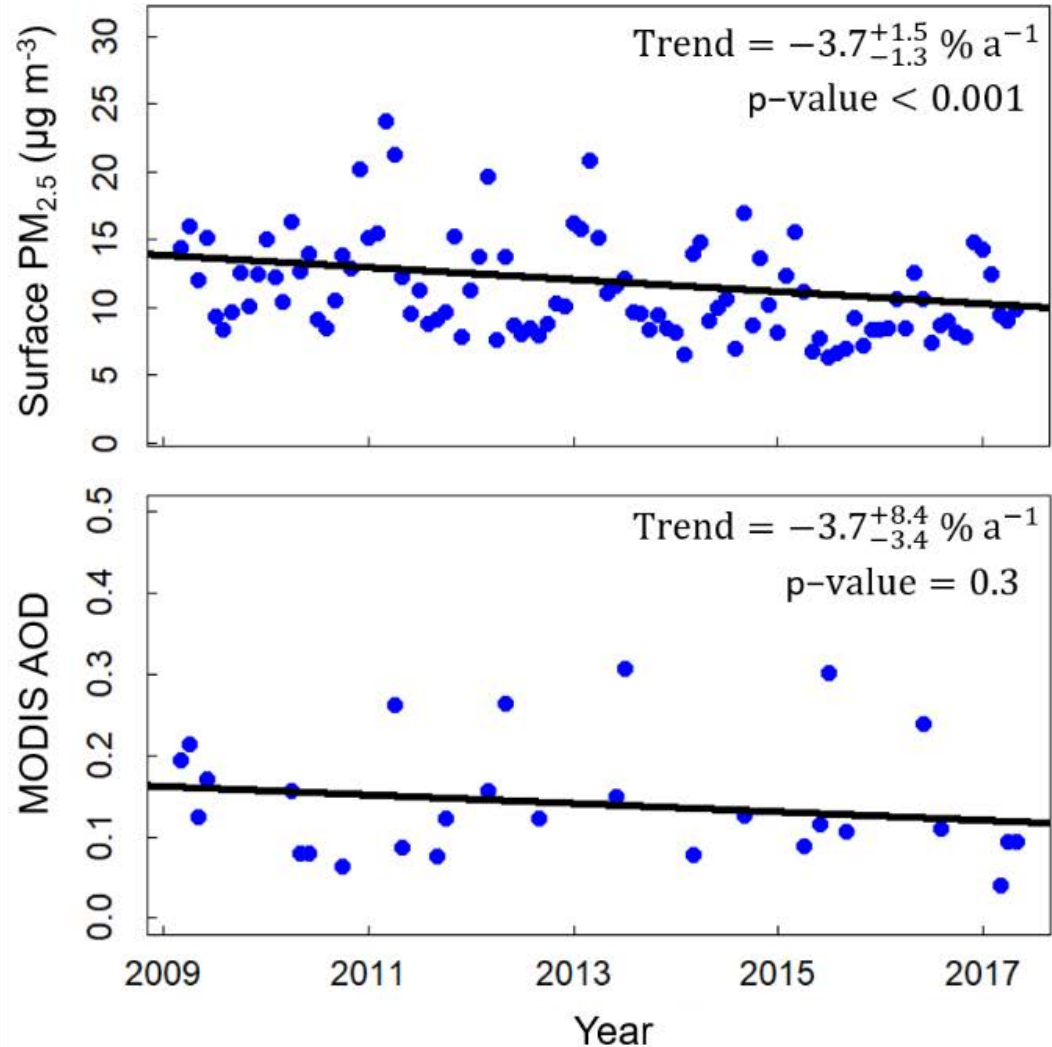

## Satellite AOD versus surface PM<sub>2.5</sub> in Birmingham, UK (2009-2017)

Complicated by meteorological conditions,  
aerosol composition & vertical distribution

[van Donkelaar et al., 2016; Shaddick et al., 2018]

## Birmingham (2009-2017)

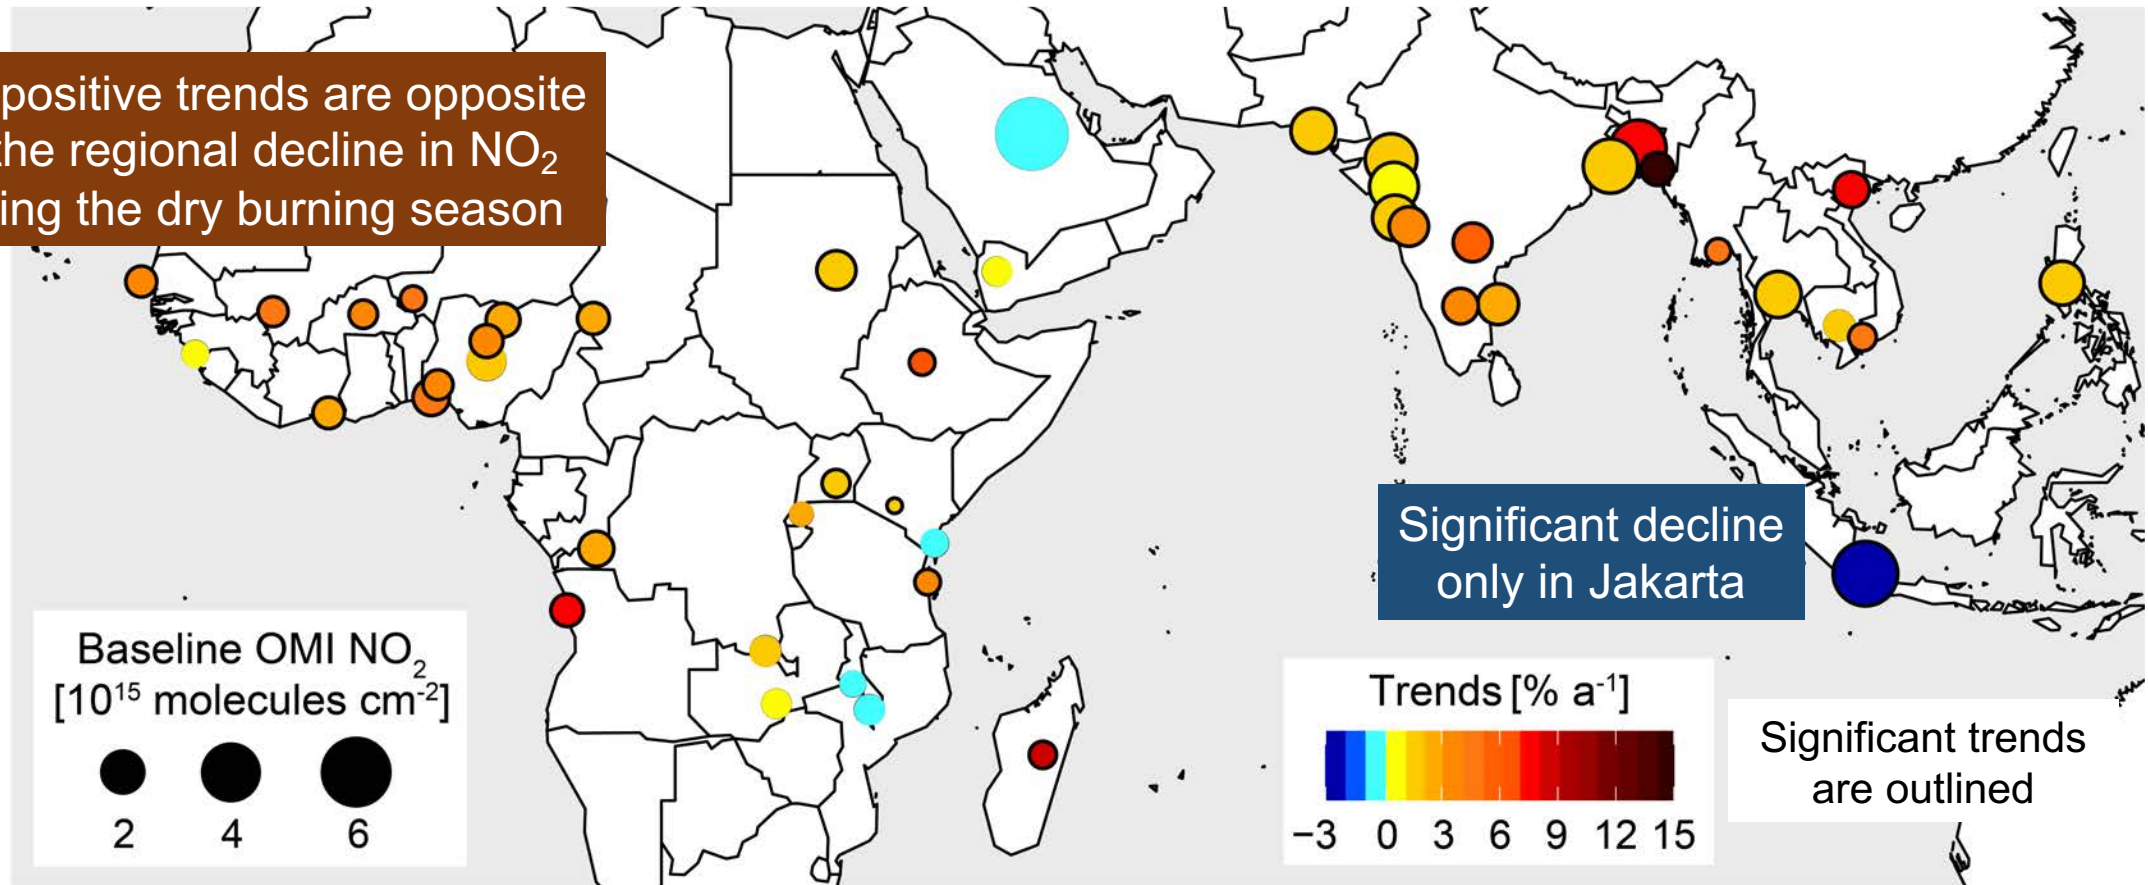

[Vohra et al., *ACP*, 2021]

# Trends in NO<sub>2</sub> in tropical future megacities in 2005-2018

NO<sub>2</sub> increases in 41 cities by 0.1-14.1 % a<sup>-1</sup>

Our positive trends are opposite to the regional decline in NO<sub>2</sub> during the dry burning season

Steep increases in NO<sub>2</sub> with implications for ozone formation and aerosol nitrate

# Trends in ozone production regimes in 2005-2018

Satellite observations of  $\text{HCHO}/\text{NO}_2$  are used as proxy for ozone production regimes

$\text{HCHO}/\text{NO}_2$

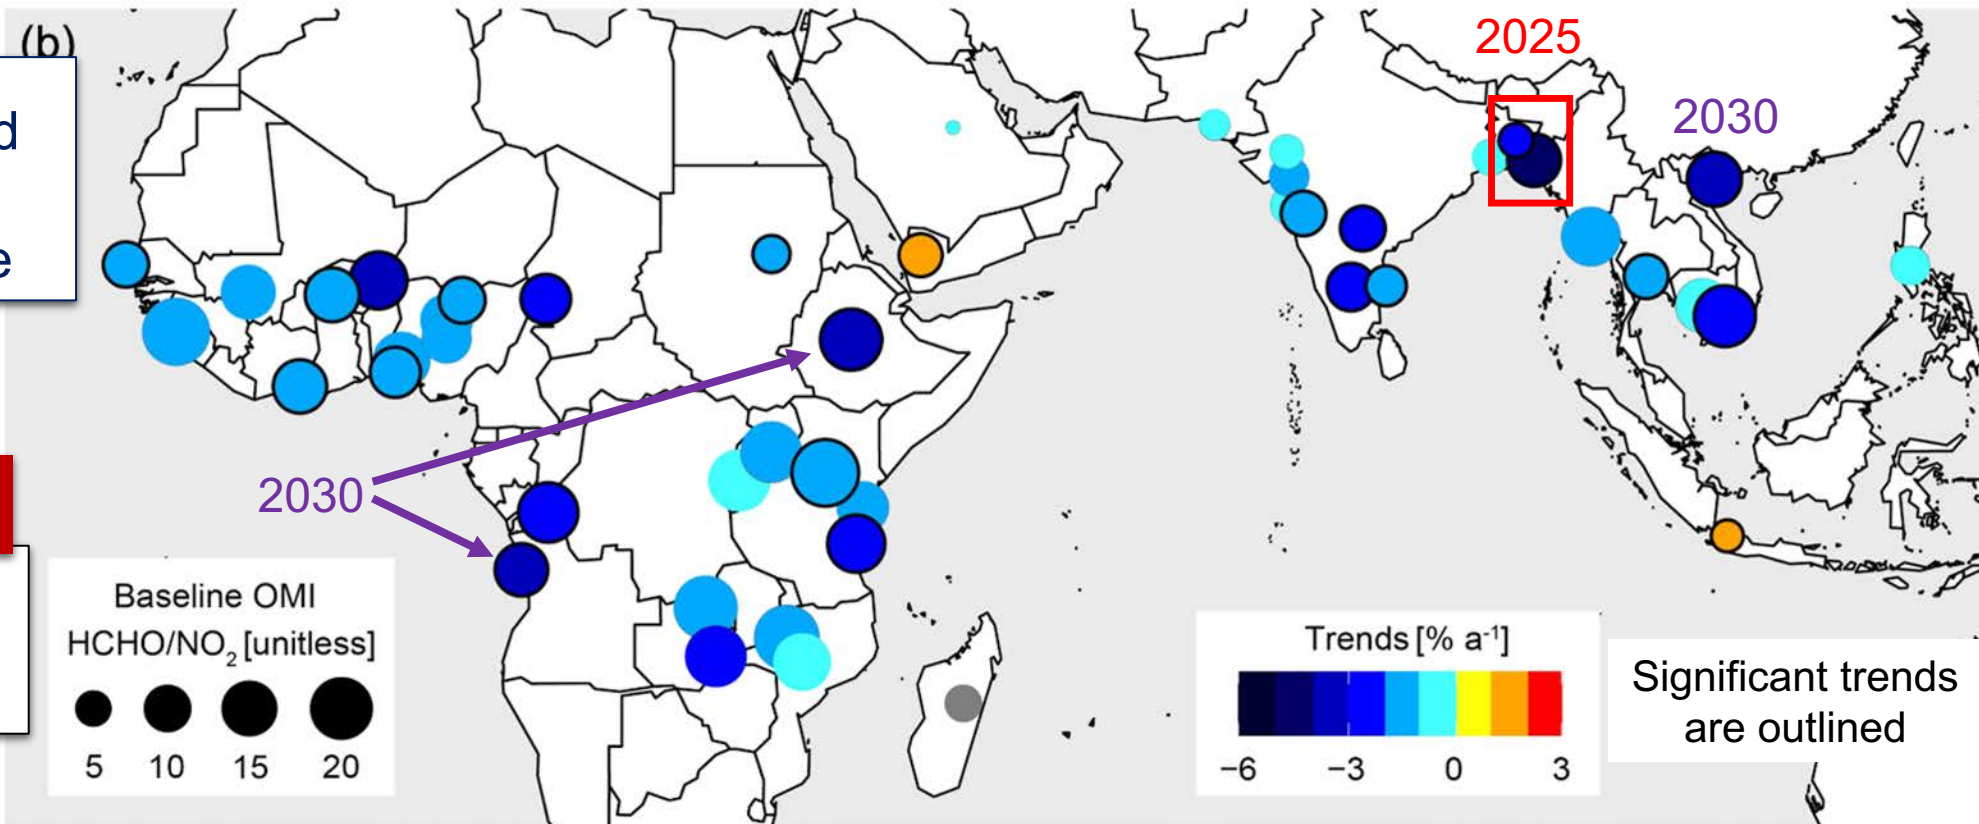

$< 1 \Rightarrow \text{NO}_x\text{-saturated}$   
 $\sim 1\text{-}4 \Rightarrow \text{transition}$   
 $> 4 \Rightarrow \text{NO}_x\text{-sensitive}$

[Martin et al., 2004;  
Jin et al., 2015]

## Limitation

Threshold for regime transition depends on local oxidation regime

[Jin et al., 2017;  
Souri et al., 2020]

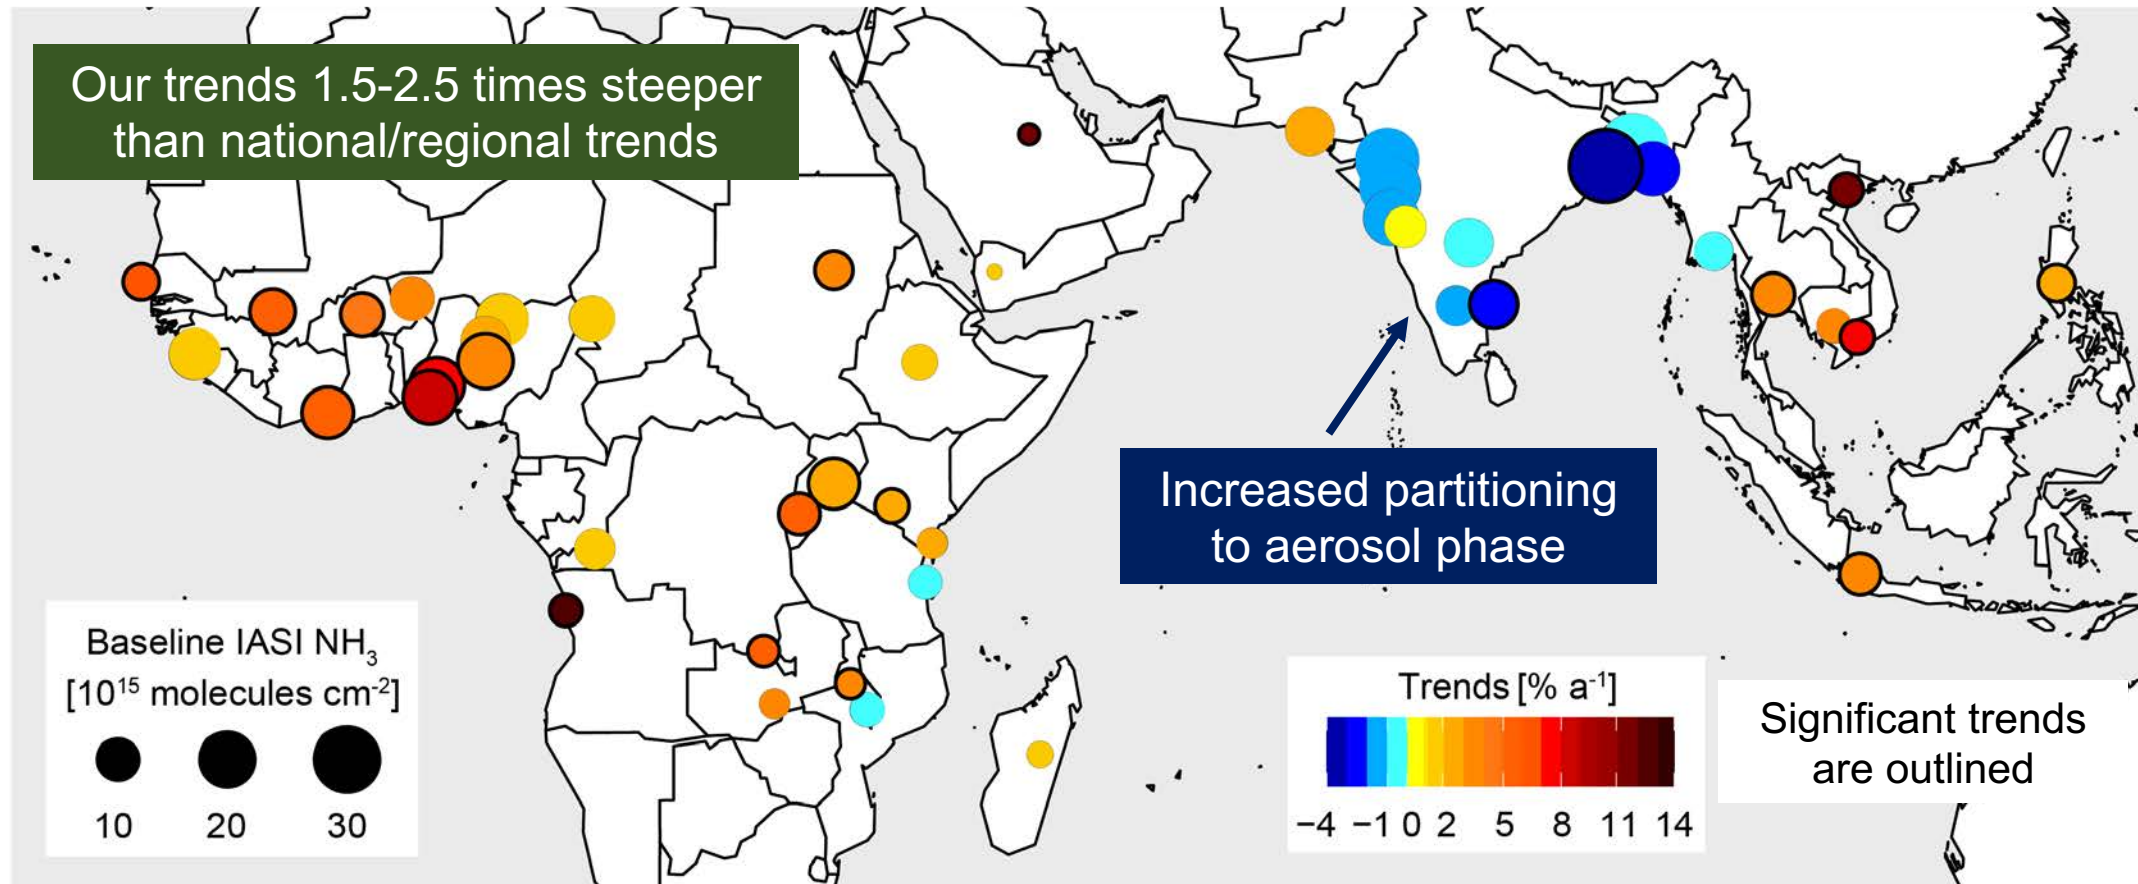

All cities except Riyadh are in  $\text{NO}_x$ -sensitive regime; Jakarta and Sana'a will remain in  $\text{NO}_x$ -sensitive regime; Gradual transition to  $\text{NO}_x$ -saturated regime may occur as early as 2025

[Vohra et al., *Sci. Adv.*, 2022]

# Trends in $\text{NH}_3$ in tropical future megacities in 2008-2018

$\text{NH}_3$  increases in cities in all regions except the Indian subcontinent

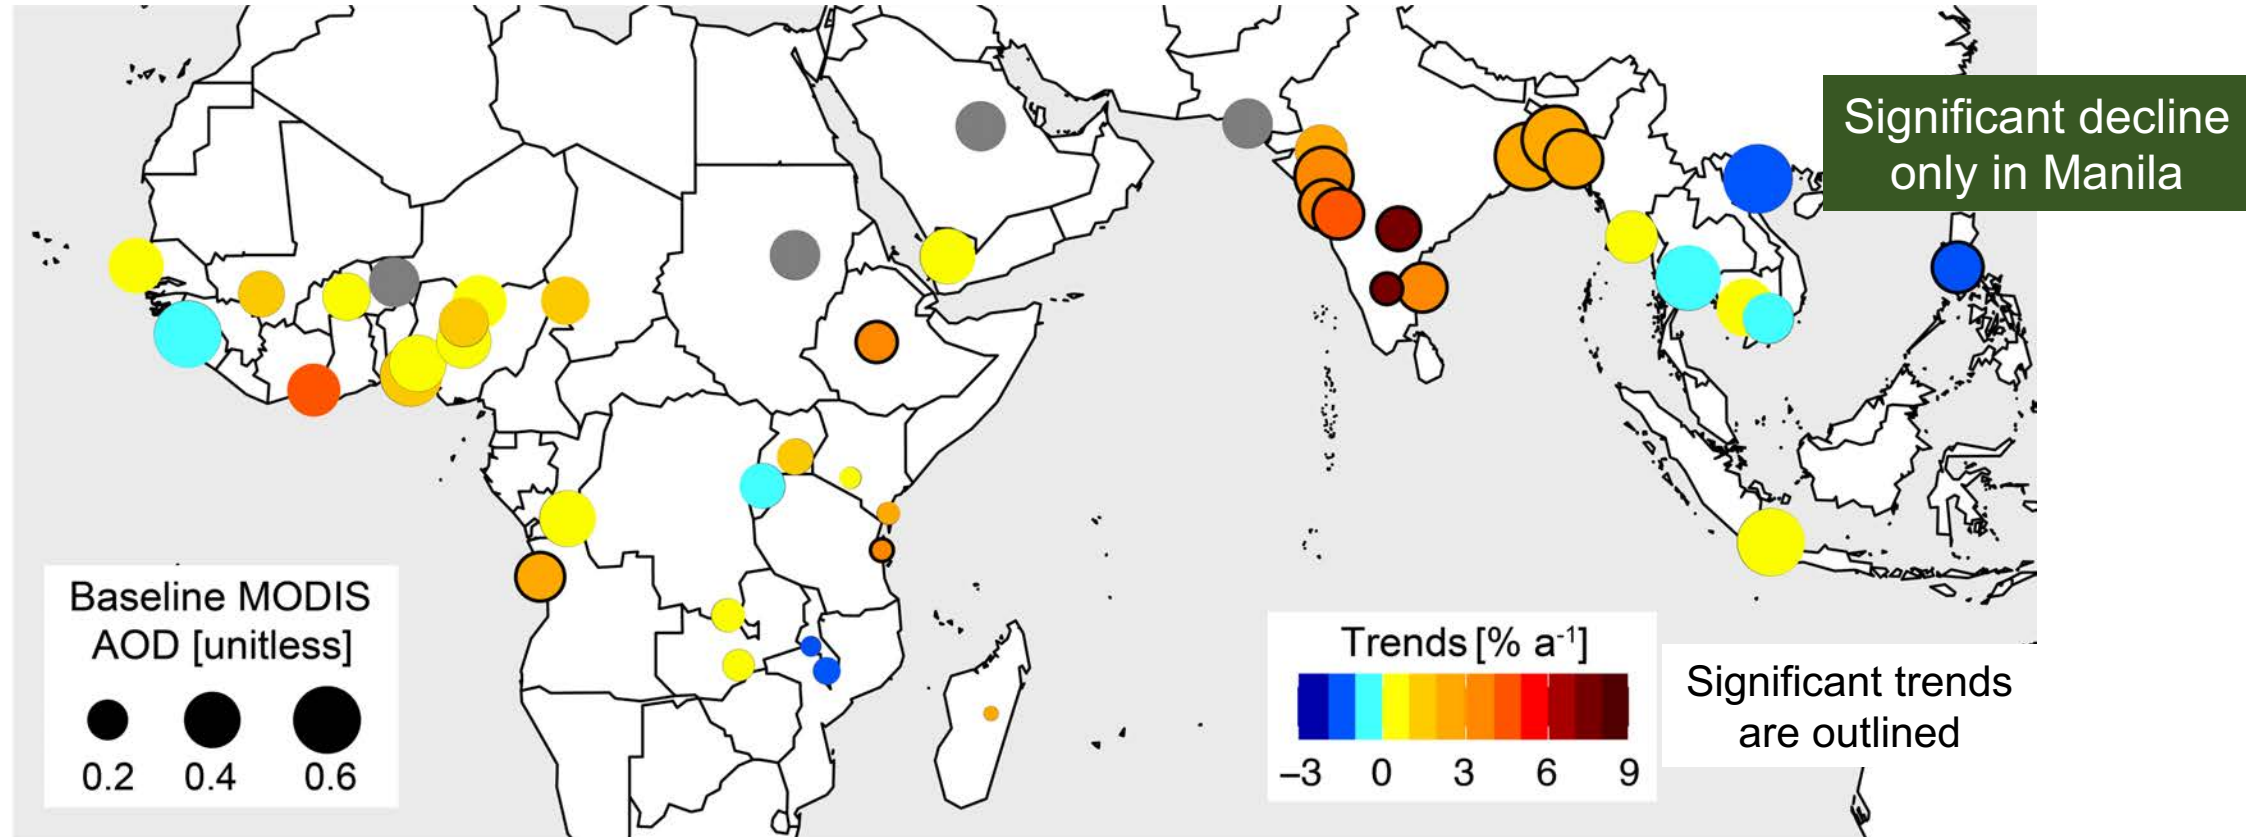

Steep increasing trends in cities in Africa and Southeast Asia may reflect increasing urban sources of  $\text{NH}_3$

[Vohra et al., *Sci. Adv.*, 2022]

# Trends in PM<sub>2.5</sub> in tropical future megacities in 2005-2018

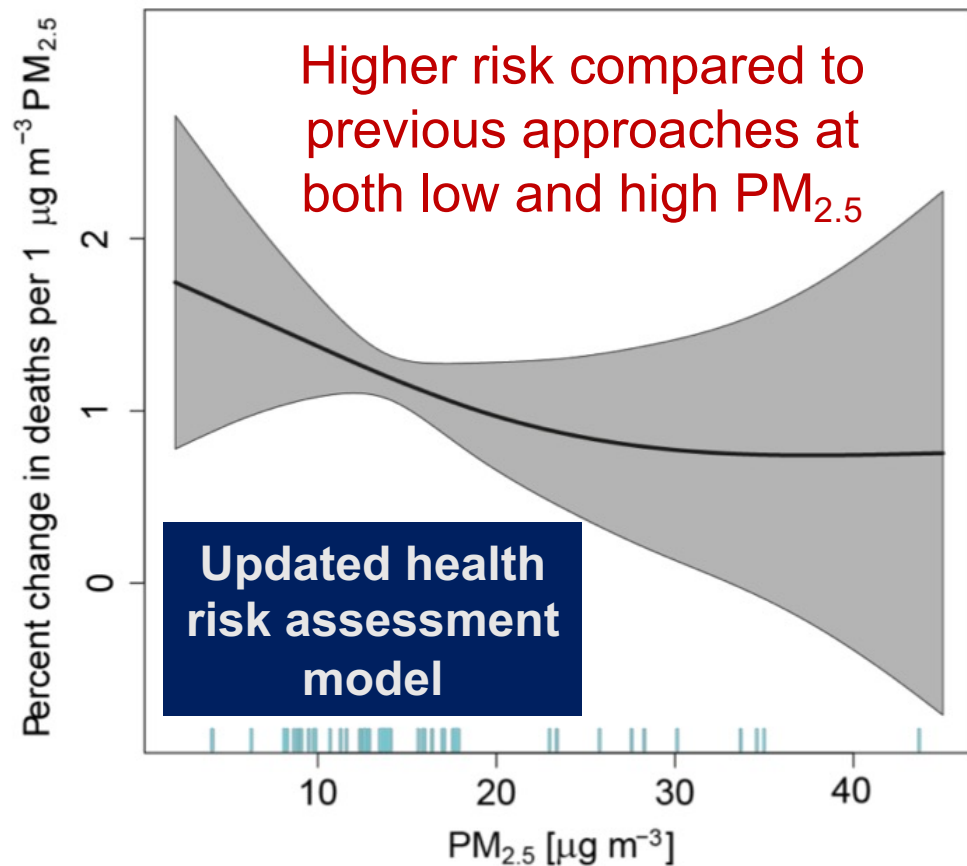

Large and significant increases of 3-8 % a<sup>-1</sup> in PM<sub>2.5</sub> over Indian subcontinent

The large increase in South Asian cities is driven by an increase in PM<sub>2.5</sub> precursor emissions and not desert dust

# Determine premature mortality from exposure to PM<sub>2.5</sub>

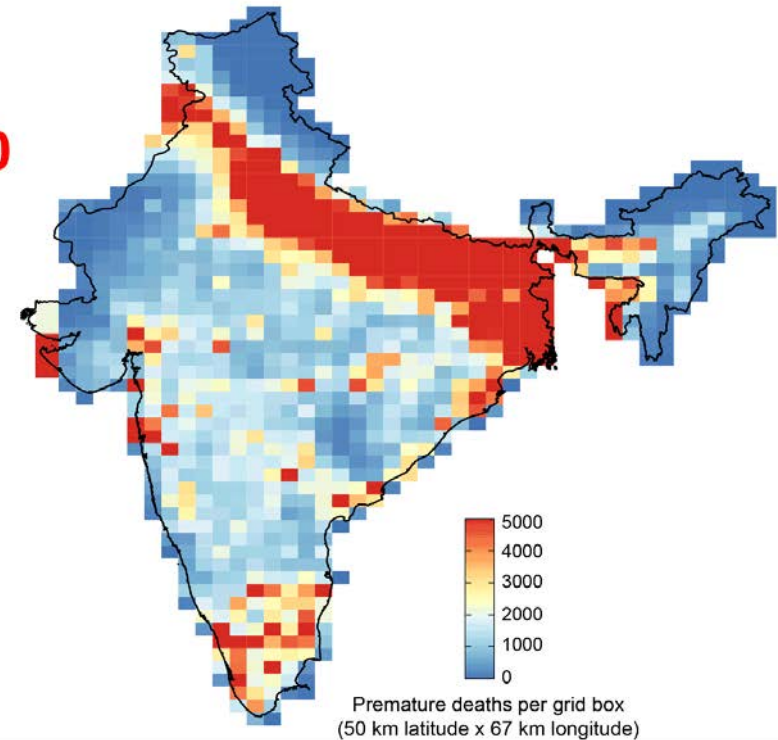

More cohorts, wider age and PM<sub>2.5</sub> range and more health endpoints than GBD function

[Vodonos et al., 2018]

Our premature mortality estimates are 3 times higher than previous studies

India  
2,500,000

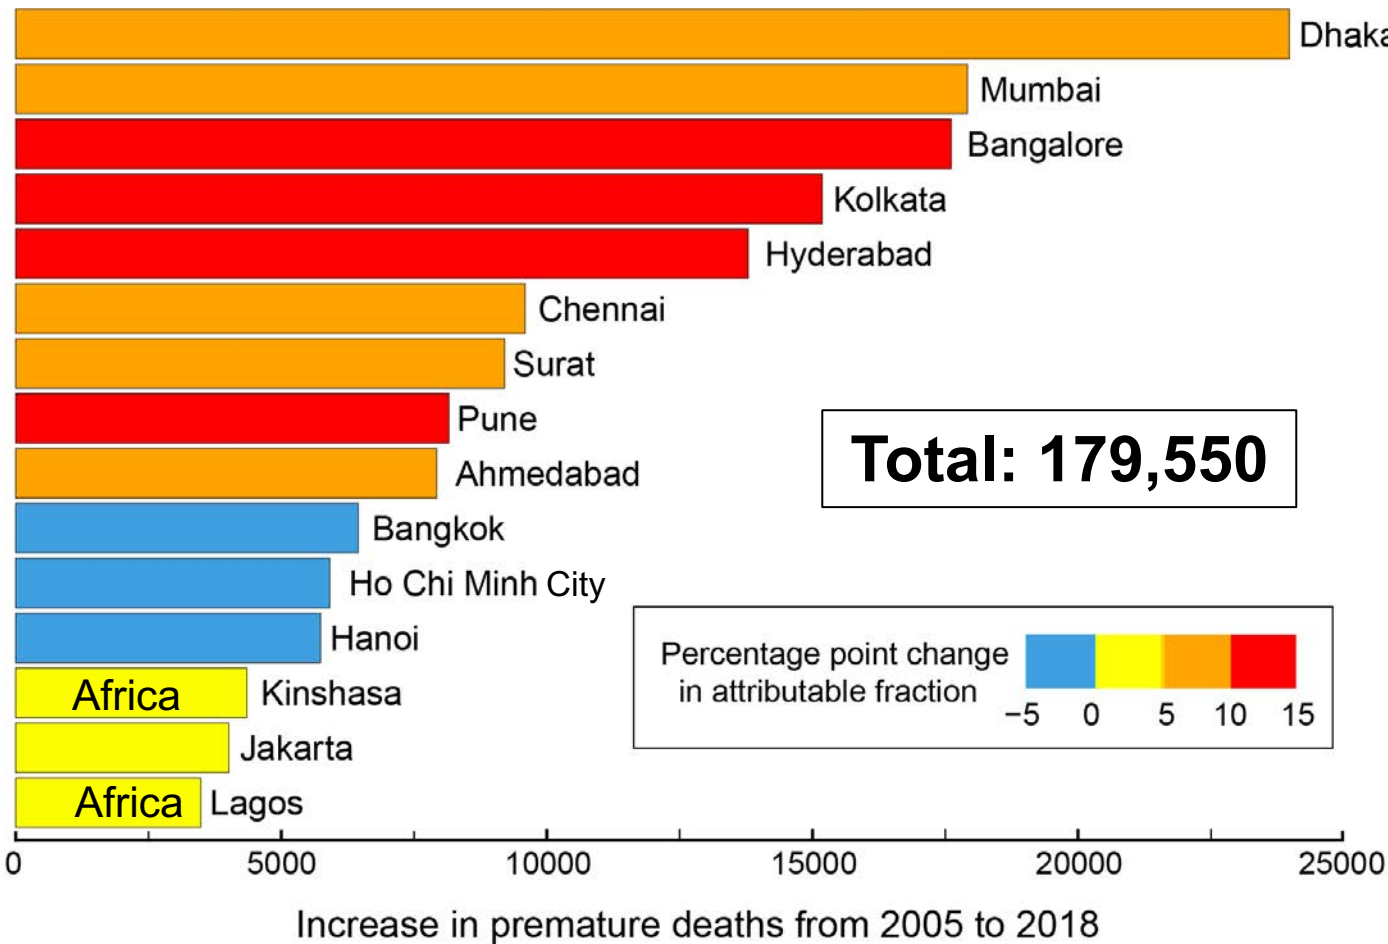

Premature deaths linked to PM<sub>2.5</sub> from fossil fuel combustion in 2012

[Vohra et al., *Environ. Res.*, 2021]

# Severe health burden in tropical future megacities

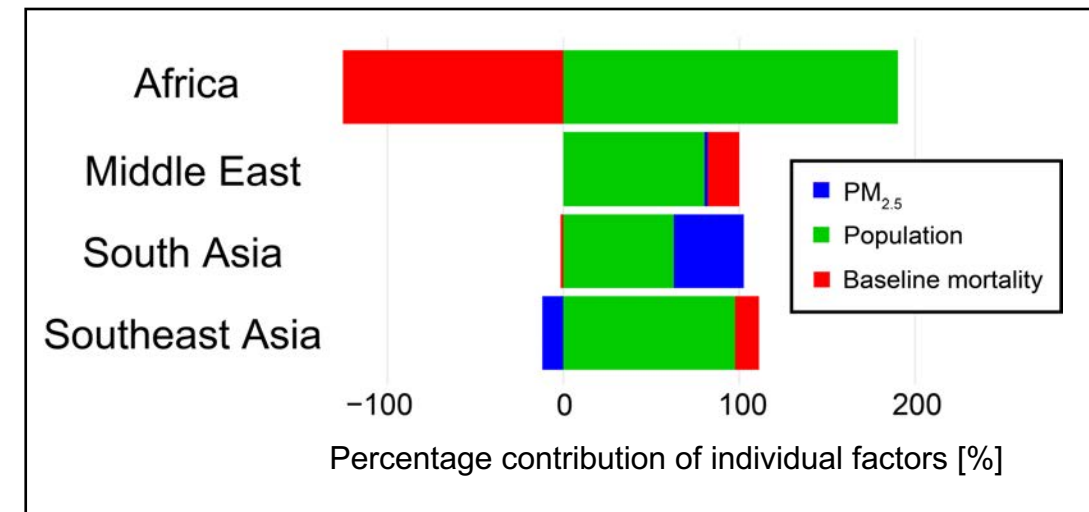

## Premature mortality from long-term PM<sub>2.5</sub> exposure

**2005** **290,000** (95% CI: 200,000 to 370,000)

**62% ▲**

**2018** **470,000** (95% CI: 70,000 to 870,000)

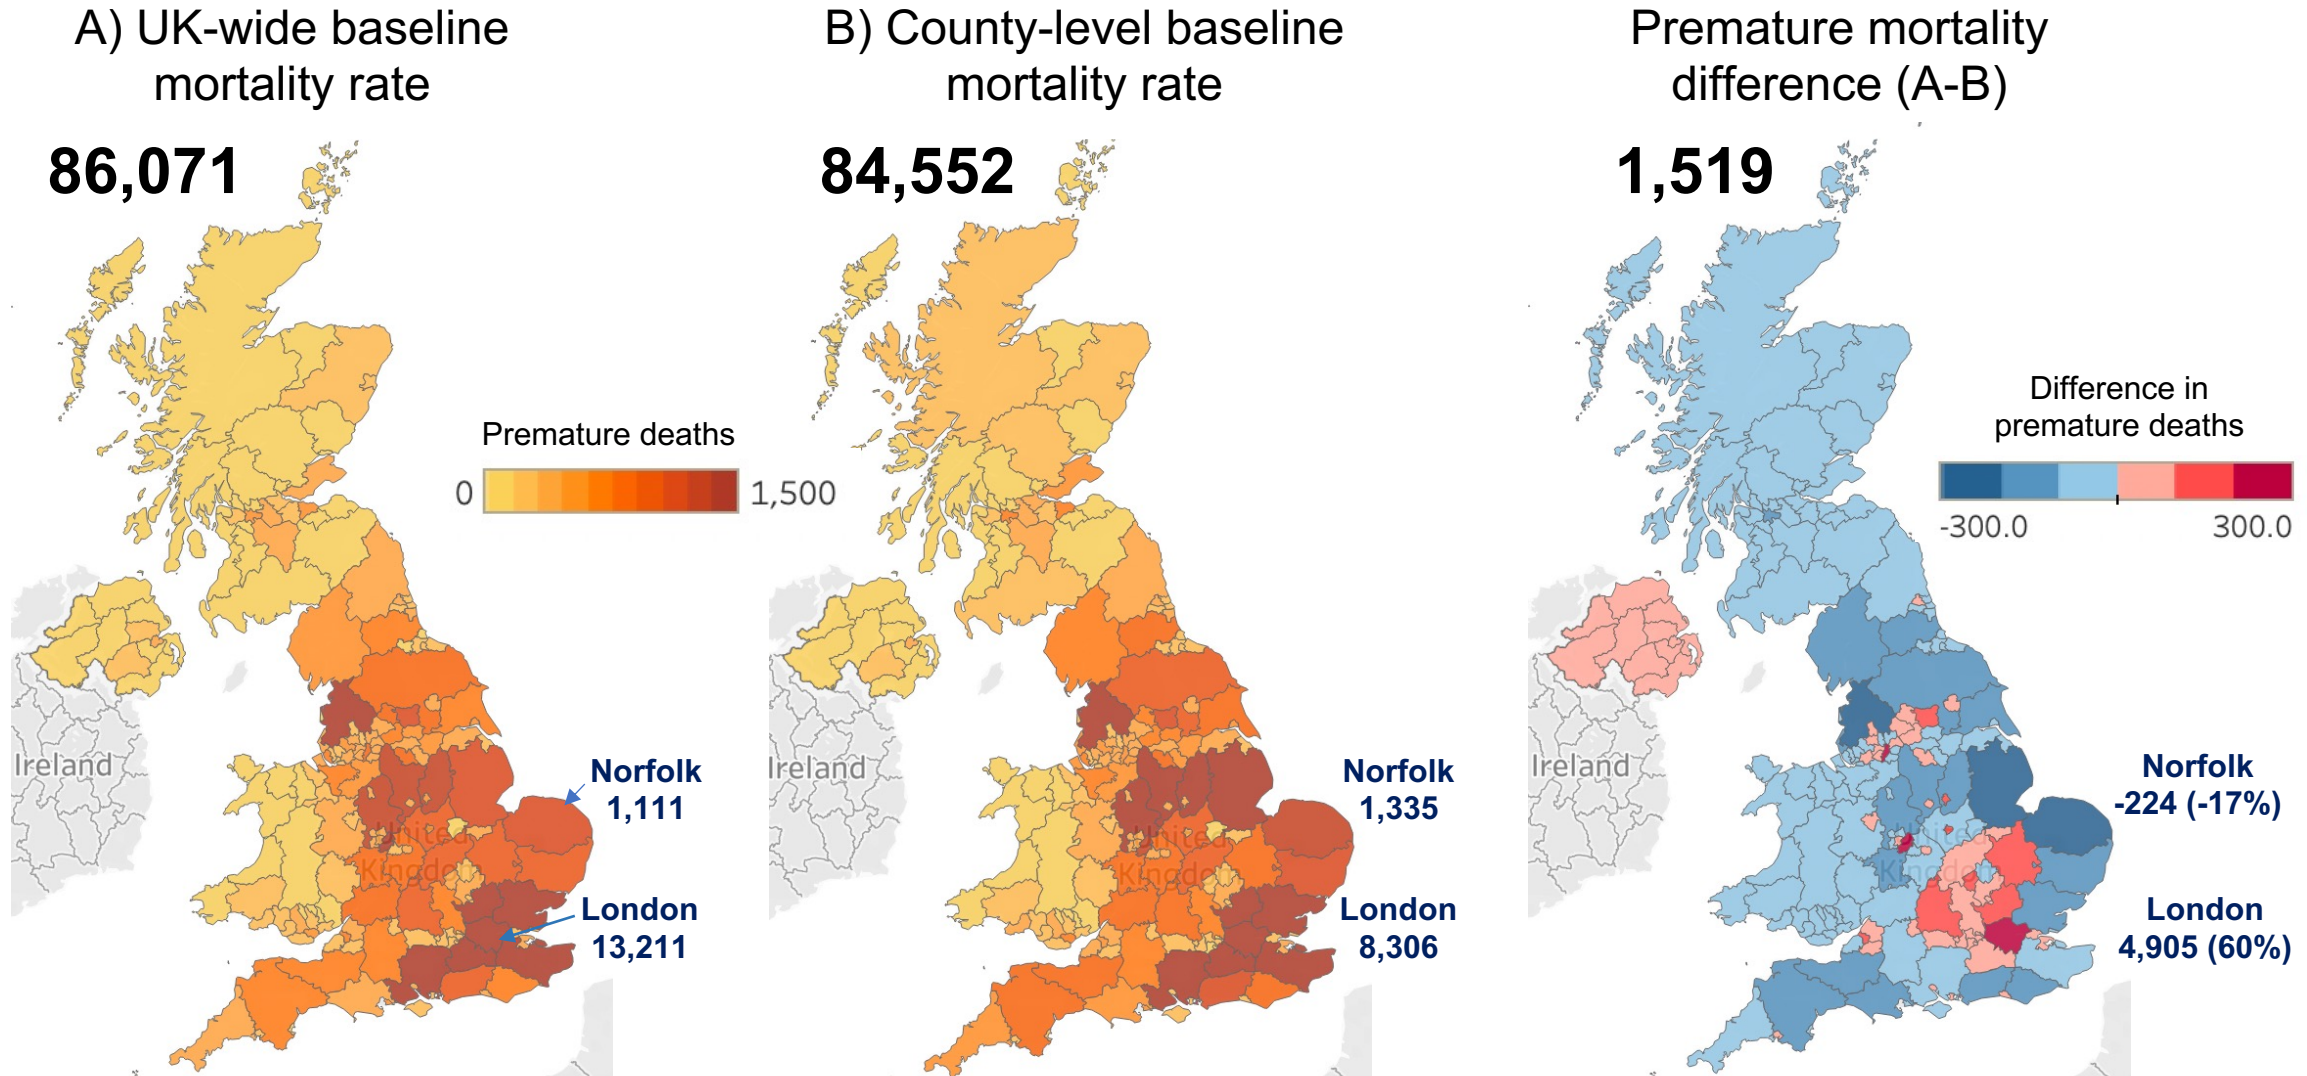

Largest increases in premature mortality in cities in Asia

Effects of PM<sub>2.5</sub> on health in African cities countered by decline in baseline mortality rate

[Vohra et al., *Sci. Adv.*, 2022]

# Implications of national baseline mortality rates on health burden

We overestimate premature deaths in densely populated regions and so we need sub-national baseline mortality rates

# Conclusion

- Most pollutants in almost all tropical cities increase at rates 2-3 times faster than or opposite in direction to reported national and regional trends
- Only Jakarta shows evidence of air quality improvements due to policy measures, and those improvements have had a limited effect, leading to decline in  $\text{NO}_2$  but not in  $\text{NH}_3$  or  $\text{PM}_{2.5}$
- Ozone formation is on track to transition from strongly  $\text{NO}_x$ -sensitive to the more challenging to regulate VOC-sensitive regime
- We estimate an increase in premature mortality of **180,000** from 2005 to 2018 linked to the rapid rise in anthropogenic air pollution in these fastest-growing tropical cities
