

Health impact of future fossil fuels in Africa

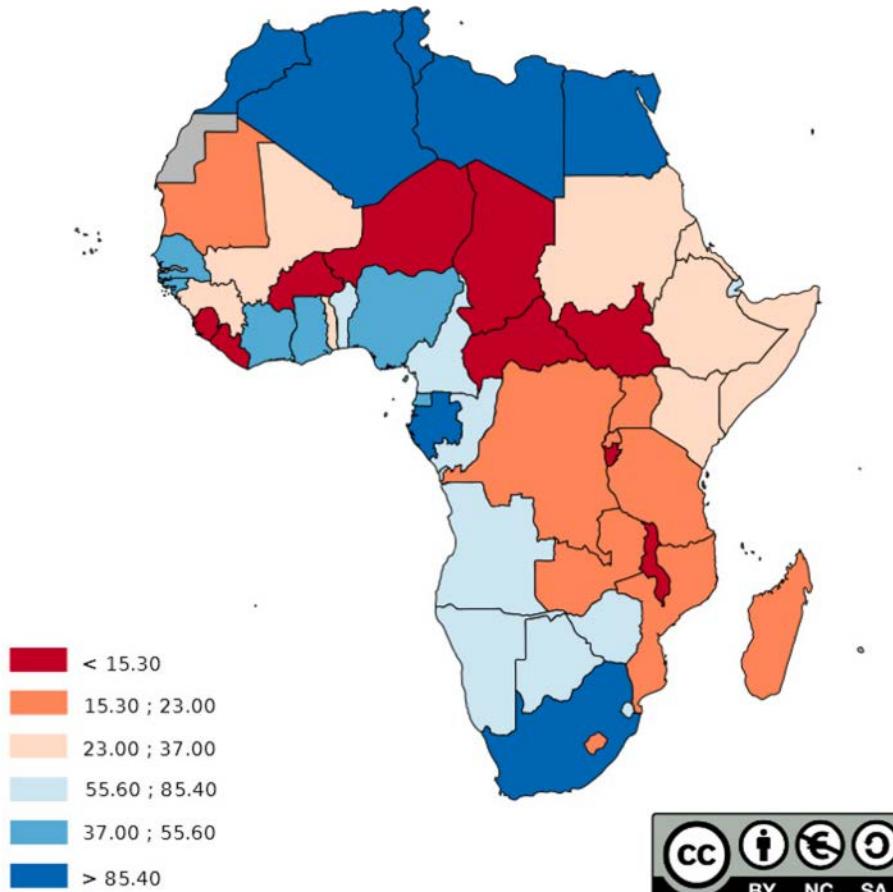

Eloise Marais, with R. F. Silvern, L. J. Mickley,
A. Vodonos, J. Schwartz, A. S. Bockarie

UNIVERSITY OF
LEICESTER

Limited Access to On-Grid Electricity

Access to Electricity (% of population)

Source : The World Bank - 2012

Copyright © Actualitix.com All rights reserved

Varies from >85% for South Africa to <15% for Chad/Niger/Malawi

Widespread Open Burning of Biomass

Dominant contributor to surface ozone and PM_{2.5}

**Burned area annual mean
(2001-2012)**

**Burned area annual trend
(2001-2012)**

[Andela et al., 2014]

Declining north of the Equator due to changes in land cover
(transition to agriculture)

Air Pollution in Africa

Seasonal mean OMI tropospheric NO₂ for 2006-2007

[Adapted from Marais and Chance, 2015]

Much of what we see from space is open burning of biomass

Unique mix of anthropogenic sources

Black Carbon

[Marais and Wiedinmyer, 2016]

Similar in magnitude to emissions from open burning

Emissions Trends and Projections for Africa

CO (Tg)

NO_x (Tg NO)

SO₂ (Tg)

NMVOCs (Tg)

OC (Tg C)

BC (Tg C)

HCHO (Tg)

Benzene (Tg)

— DICE-Africa

— RCP 4.5

○ Bond et al. (2004)

--- This study + hard coal

— RCP 8.5

✗ Bond et al. (2013)

— This study + trash burning

● EDGAR v4.2

□ ACCMIP

— Liousse et al. (2014)

▼ RETRO v2

Wide range of emissions trends and projections.

Future Adoption of Fossil Fuels in Africa

[Marais et al., 2019, doi:10.1021/acs.est.9b04958]

The Wallace Foundation®

Coal and Natural Gas Use in Africa

Per capita generating capacity

Generating capacity to increase by almost 300%
(mostly North and southern Africa)

... And also Powerships

Interim solution for a country to increasing generating capacity

Run on **bunker fuel**

Already in use in Ghana and Mozambique (Zambia)

Emissions from current and future fossil fuels

Black: total continent emissions

Fractional contribution from power plants (**orange**) and vehicles (**green**)

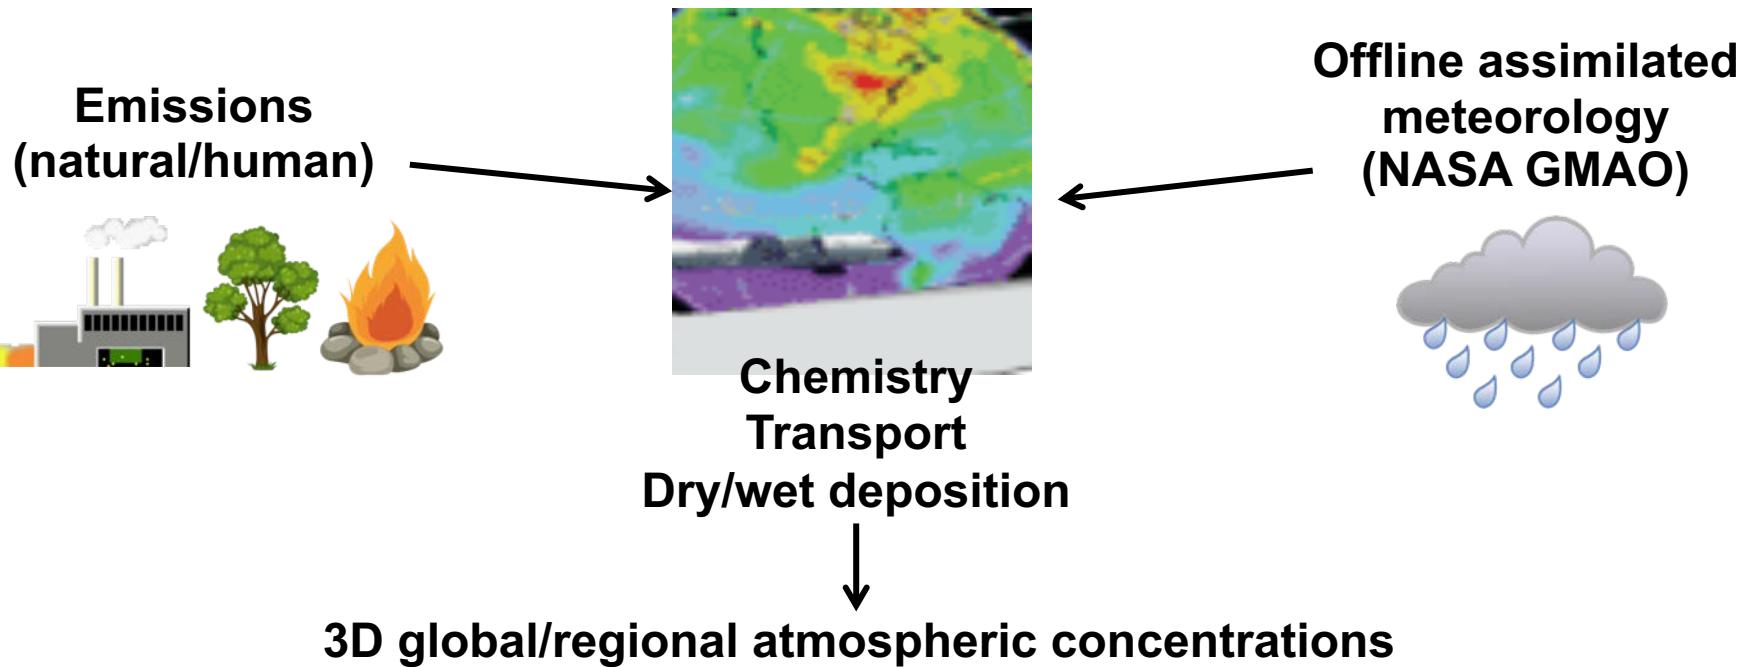

Evidence of AQ Degradation from Space

TROPOMI NO_2 and SO_2 at $0.1^\circ \times 0.1^\circ$ for May-Sep 2018

Satellite observations support air quality degradation at the location of the new Medupi power plant

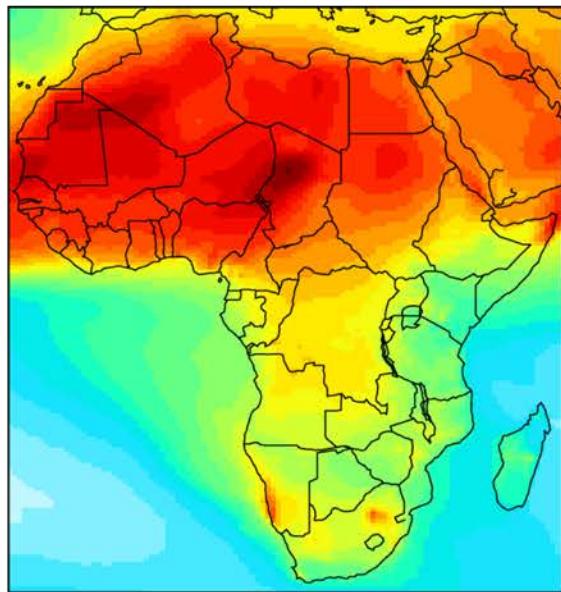

Model PM_{2.5} and ozone from future fossil fuels

Model is nested over Africa at 50-67 km

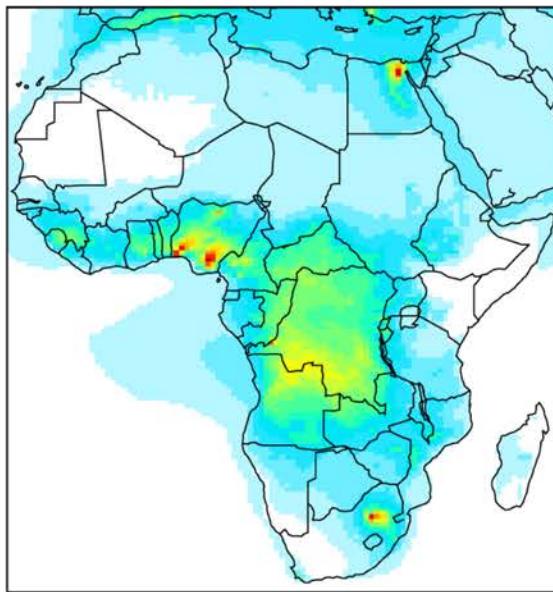

Current PM_{2.5} and the contribution from future fossil fuels

2012 PM_{2.5}
(all components)

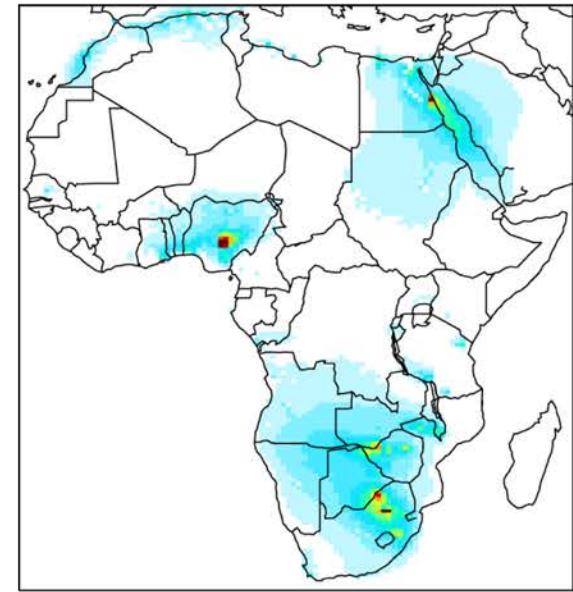

0.40 4.00 40.0 400 [µg m⁻³]

2012 PM_{2.5}
(no dust or sea salt)

0 10 20 30 40 [µg m⁻³]

2030 minus 2012 PM_{2.5}

0 2 4 6 8 [µg m⁻³]

Absolute contribution dominated by dust

>8 µg m⁻³ increase in locations in Nigeria, Egypt and South Africa

Model current ozone and the future fossil fuel contribution

NO_x titrates ozone at densely populated areas and point sources

2-3 ppbv increase may impact agricultural productivity

How close is the model to reality?

[OpenAQ, Accessed 10 November 2019]

Open access, reliable PM_{2.5} and ozone measurements severely limited

Turn to PM_{2.5} derived with satellite observations of AOD

Comparison of model and satellite-derived PM_{2.5} across Africa

Annual mean satellite-derived PM_{2.5} (μg m⁻³)

[van Donkelaar et al., 2010]

Consistent and unbiased after reducing windblown dust emissions by 40%

... And quality checked network observations

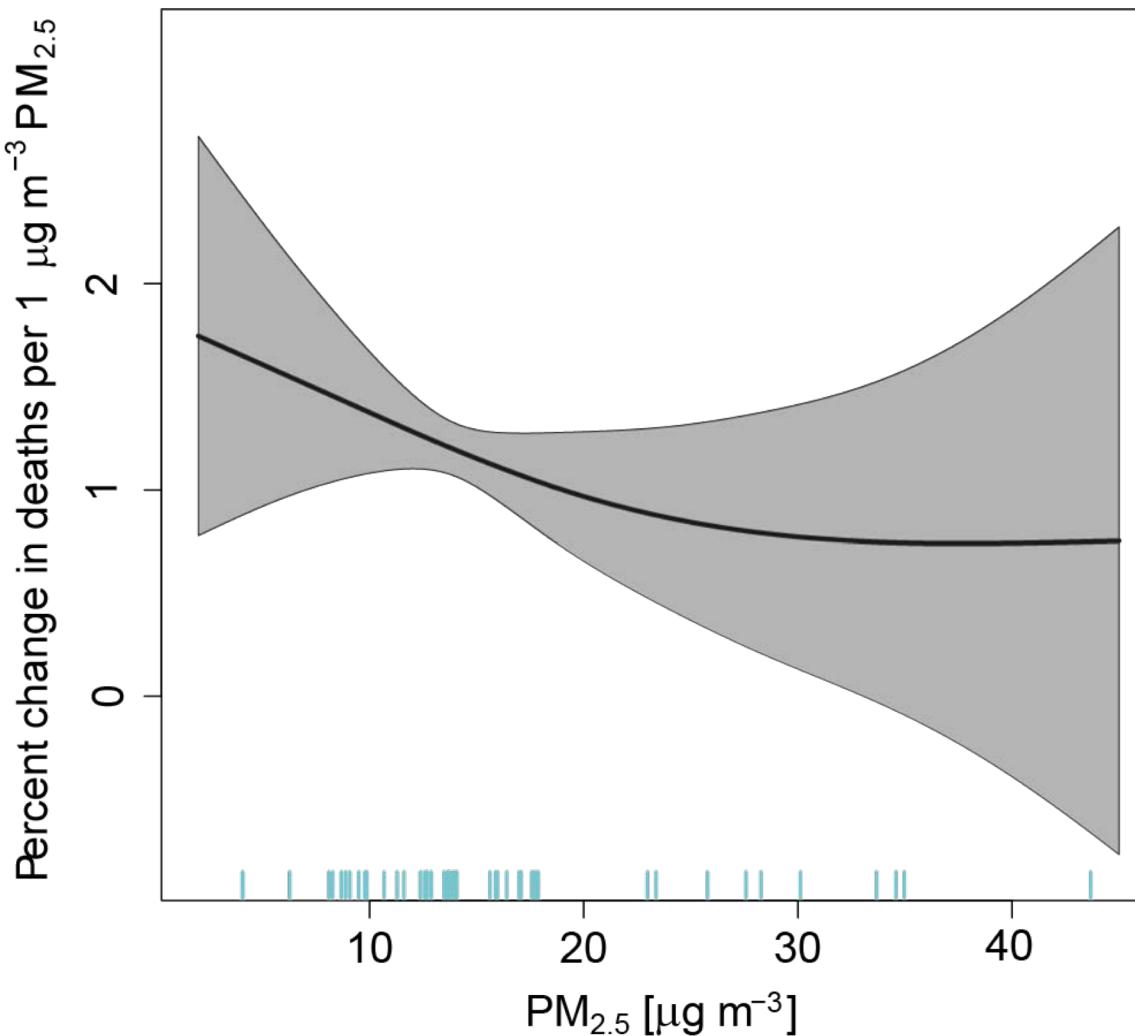

Comparison of model and satellite-derived PM_{2.5} to surface observations
limited to South Africa

[PM_{2.5} annual means from Garland et al. (2013)]

Model overestimates PM_{2.5} due to overestimate in trash burning

Premature Mortality due to PM_{2.5} Exposure

Use the concentration-response function of Vodonos et al. (2018) that includes exposure at PM_{2.5} > 40 $\mu\text{g m}^{-3}$

Annual Avoidable Deaths in 2030

Total for Africa: **48,000** in 2030

Factor of 3 larger contribution from power plants than transportation

Reactive Nitrogen in the Upper Troposphere

Ozone production efficiency from NO_x sources

[adapted Dahlmann et al., 2011]

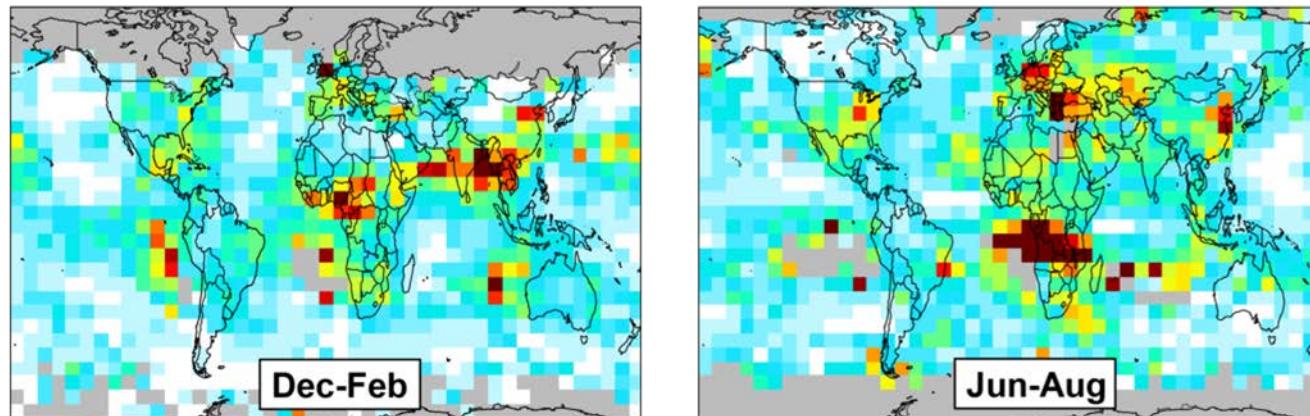

Greater ozone production efficiency in the upper troposphere than the surface

Measurements of NO_x in the upper troposphere are very limited

Constraints from UT NO₂ products

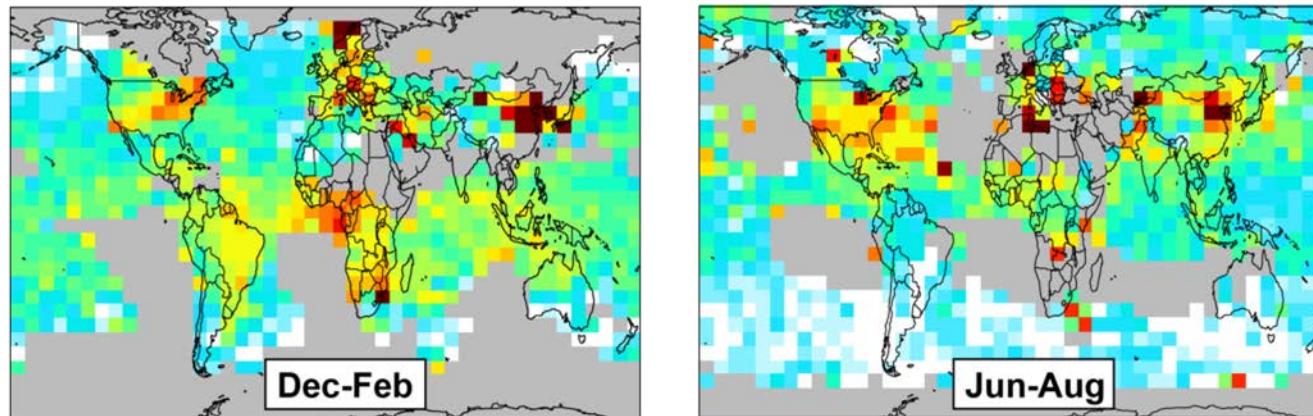

[Marais et al., 2018, doi:10.5194/acp-18-17017-2018]

KNMI (2006)

[Maria Belmonte-Rivas]

NASA (2005-2007)

[pptv]

[Sungyeon Choi,
Joanna Joiner]

Inconsistent: poor spatial correlation, KNMI 16-48% lower than NASA

Arbitrate with aircraft observations of NO₂

Spring-summer multiyear aircraft campaigns from the NASA DC8 aircraft

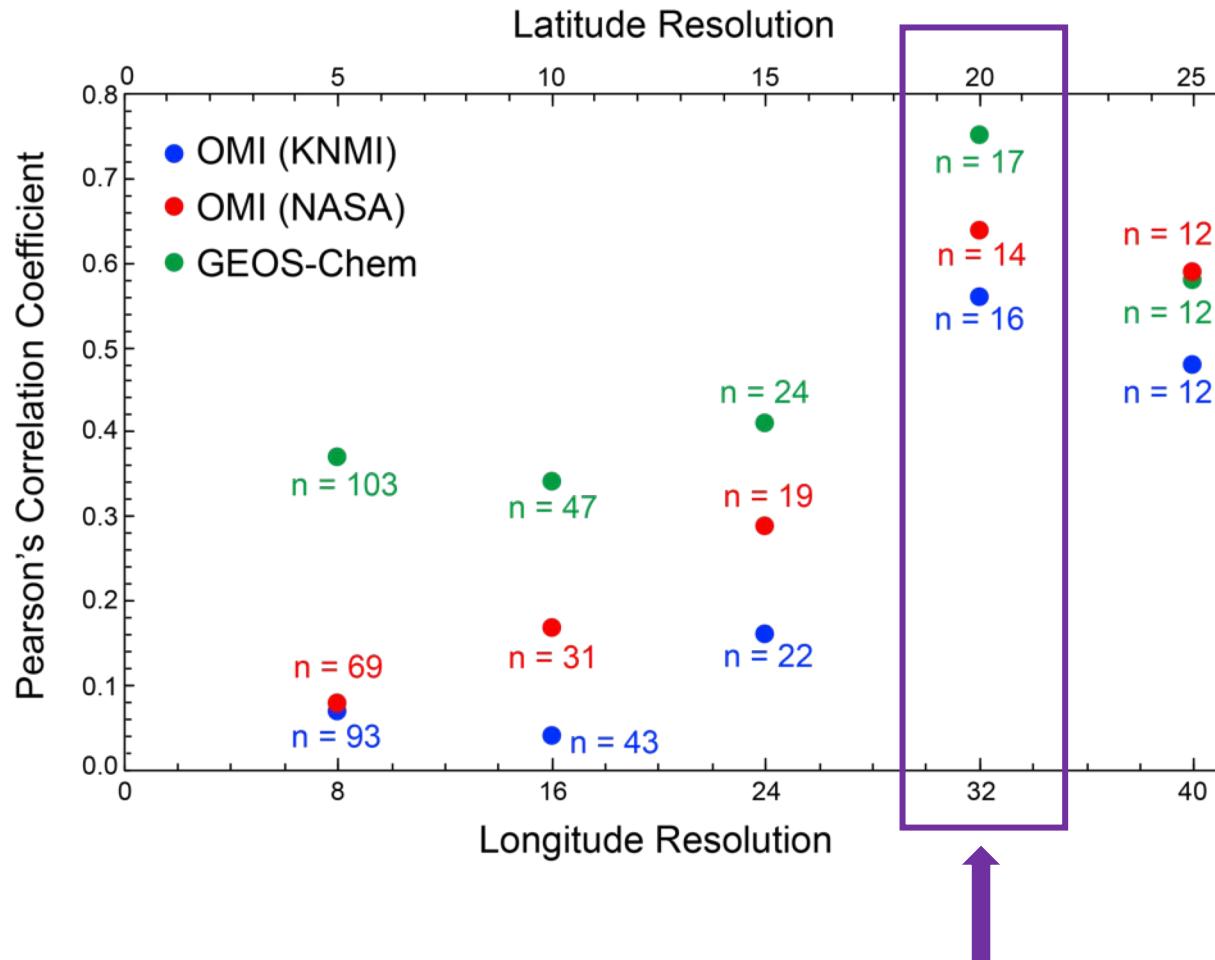

[Ron Cohen's TD-LIF instrument]

Campaigns extend from 2004 (INTEX-A) to SEAC⁴RS (2013)

Arbitrate with aircraft observations of NO₂

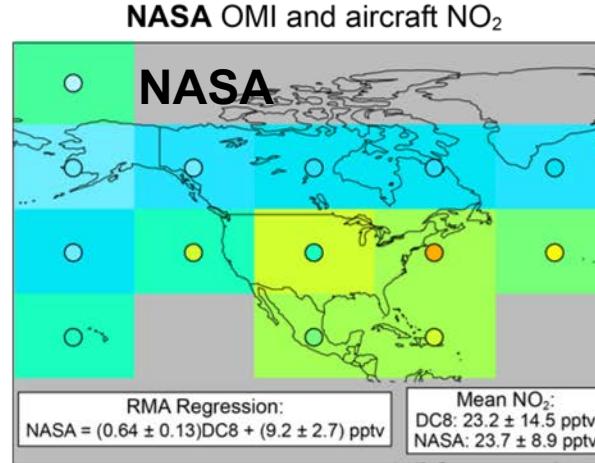

Spatial consistency of aircraft and satellite observations

Greatest consistency at 20° × 32° (~2000 km × 3200 km)

Arbitrate with aircraft observations of NO₂

Quantitative consistency of aircraft and satellite observations

NASA more consistent with aircraft observations than KNMI

Satellite and model overestimate background, underestimate variability

Evaluate against GEOS-Chem

GEOS-Chem: represents best understanding of atmospheric chemistry

NASA (2005-2007)

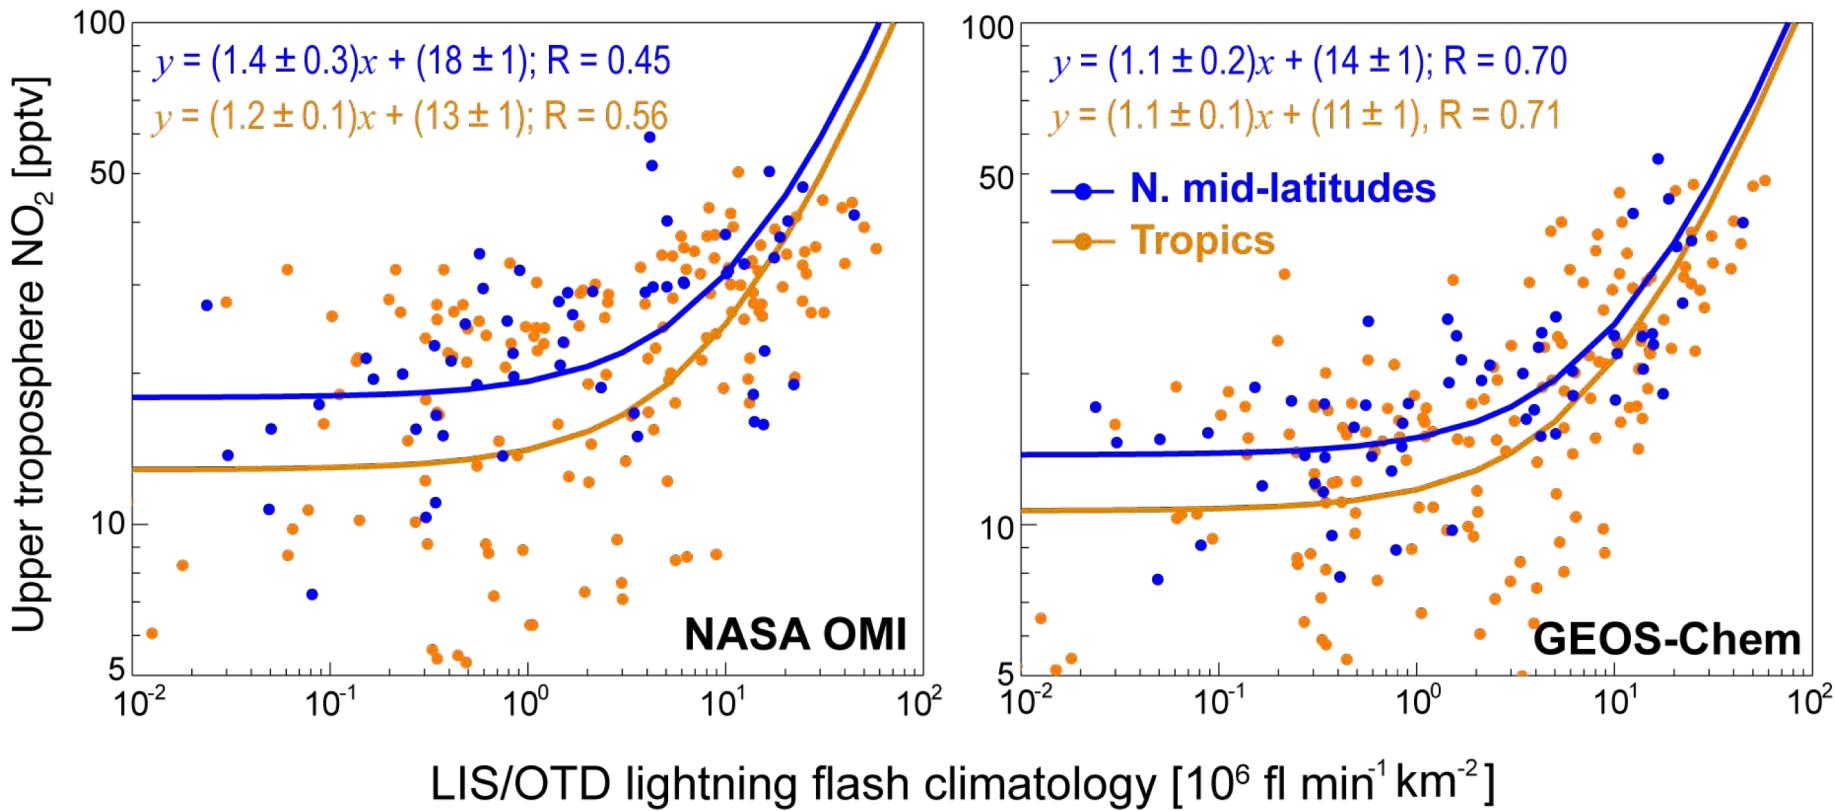

GEOS-Chem (2006)

Model underestimates NO_x in the midlatitudes in winter by 20-40 ppbv

New Constraints for lightning NO_x

Regression of UT NO₂ against satellite observations of lightning flashes

Linear fit shown in log-log space to show background NO₂ (10-20 ppbv)

No support for high **lightning NO_x production rates** in the midlatitudes (500 mol nitrogen per flash) than the tropics (260 mol nitrogen per flash)

Satellite-derived NO_x Yields per Flash

Obtain from the discrepancy between the satellite and the modelled UT NO₂

OMI-derived lightning NO_x production rates versus lightning properties

[Lighting properties from Beirle et al., 2014]

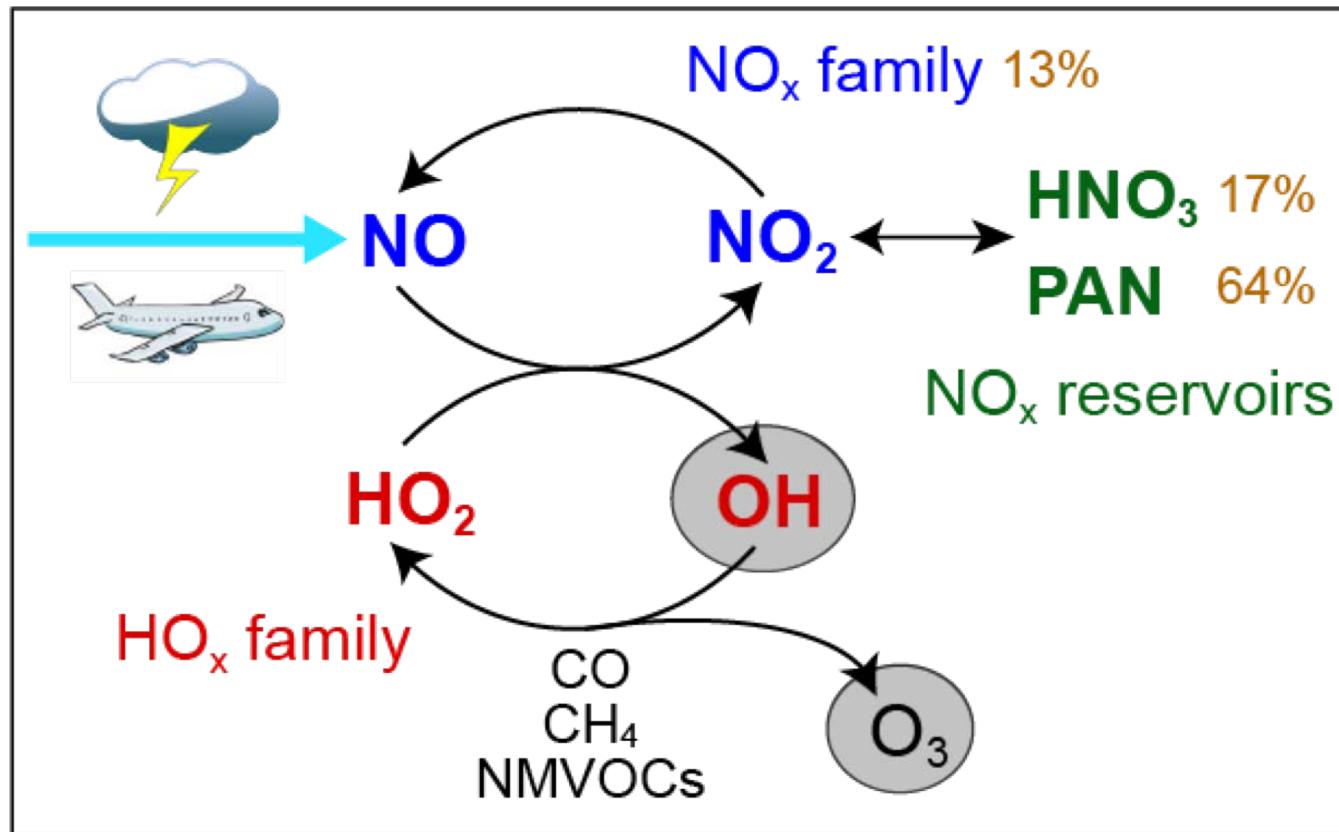

NO_x yield per flash increases with **lightning flash energy** and **footprint**

Global annual lightning NO_x emissions using OMI UT NO₂: **5.9 Tg N**
(literature review range: **3-7 Tg N**)

Global average lightning NO_x production rate: **280 mol N flash⁻¹**

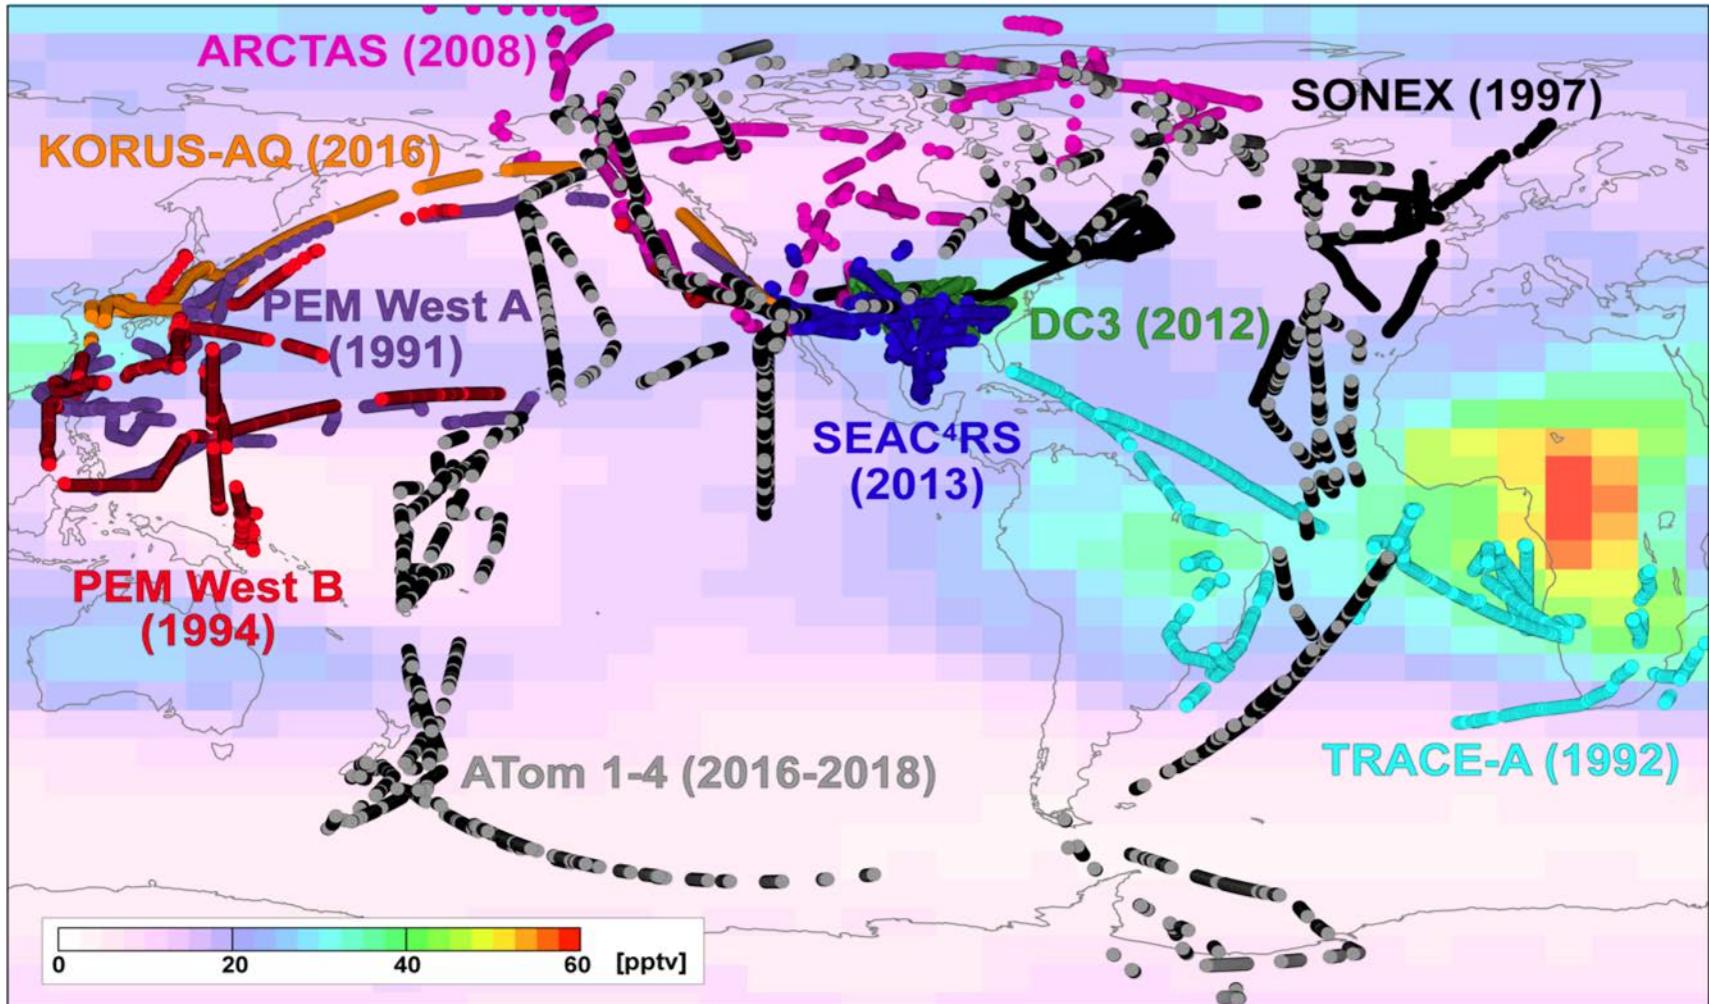

Challenge our understanding of reactive nitrogen in the global upper troposphere

Errors in processes in the upper troposphere propagate as large errors in ozone and OH

Affects air quality and climate estimates from models and satellite observations

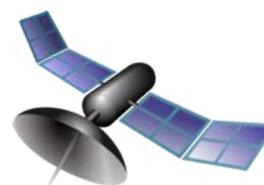

Produce a climatology of global NO_y in the UT

I'm Recruiting: Spread the Word!

ERC UpTrop Project:

Go to <http://maraisresearchgroup.co.uk/joinus.html>:

2 postdoc positions linked to the ERC project

Closing date: 11:59pm Friday 15 November

2 PhD positions soon to be advertised linked to the ERC project

Environmental Science PhD studentships:

Go to <http://centa.org.uk>

2 PhD projects as lead supervisor

1 PhD project as co-supervisor
